LIBI	LIBID	Rate at which major international banks are willing to take deposits from one another, is normally 1/8 percent below LIBOR.  London InterBank Bid Rate, the rate bid by banks on Eurocurrency deposits; the international rate that banks lend to other banks.
LIBO	LIBOR	London Interbank Offered Rate, the interest rate that major international banks in London charge each other for borrowing.
SWAP	SWAP	In curve construction, Swap is the long portion of the curve constituting about 3 years to 30 years term.  The exchange of one security, currency or interest rate for another to change the maturity (bonds), or quality of issues (stocks or bonds), or because investment objectives have changed.
TREA	Treasury	Treasury benchmark that comes in three types: the yield curve, the par curve, and the spot curve. All curves also have a constituent time series.
EURI	Euribor	Euro Interbank Offer Rate is the rate at which Euro inter-bank term deposits within the Euro zone are offered by one prime bank to another prime bank.
PFAN	Pfandbriefe	Pfandbriefe security is a collateralised bullet bond backed by either mortgage loans or loans to the public sector. Pfandbriefe differ from traditional asset-backed securities in significant ways. The most important difference is that Pfandbriefe carry no pre-payment risk since they remain on the balance sheet of the issuing institution. Therefore, their spreads over sovereign bonds are attributable to liquidity and credit quality alone. New indices have been created and existing indices have been modified in response to the growing importance of the Pfandbriefe market. The Deutsche Borse has three synthetic indices called REX, JEX, and PEX. The Pfandbriefe curve is used as a reference for credit as well as mortgage market.

## 31.3 Constraints

### C1 **ActiveOrHistoricCurrency**

The Currency Code must be registered, or have already been registered. Valid active or historic currency codes are registered with the ISO 4217 Maintenance Agency, consist of three (3) contiguous letters, and may be or not be withdrawn on the day the message containing the Currency is exchanged.

### C2 **AnyBIC**

Only a valid Business identifier code is allowed. Business identifier codes for financial or non-financial institutions are registered and published by the ISO 9362 Registration Authority in the ISO directory of BICs, and consists of eight (8) or eleven (11) contiguous characters.

### C3 **Country**

The code is checked against the list of country names obtained from the United Nations (ISO 3166, Alpha-2 code).

### C4 **DescriptionPresenceRule**

If Description is not present then either ISIN or at least one occurrence of OtherIdentification must be present.

### C5 **DescriptionUsageRule**

Description must be used alone as the last resort.

### C6 **FullSetRules**

If SmallSetReturnCriteria is not present then the full set of security reference data is expected.  
*This constraint is defined at the MessageDefinition level.*

### C7 **ISINGuideline**

When an ISIN code exists, it is strongly recommended that the ISIN be used.

### C8 **ISINPresenceRule**

If ISIN is not present then either Description or at least one occurrence of OtherIdentification must be present.

### C9 **OtherIdentificationPresenceRule**

If OtherIdentification is not present then either ISIN or Description must be present.

### C10 **SupplementaryDataRule**

This component may not be used without the explicit approval of a SEG and submission to the RA of ISO 20022 compliant structure(s) to be used in the Envelope element.

## 33      **reda.013.001.01**

# **SecurityDeletionRequestV01**

### 33.1    **MessageDefinition Functionality**

#### SCOPE

An instructing party sends a SecurityDeletionRequest message to an executing/servicing party to advise the complete removal of a financial instrument entry from their system.

The instructing party - executing/servicing party relationship may be:

- Central Securities Depositories (CSD) who would like to publish security static data, or
- a Corporate, or
- a Bank, or
- a Market Infrastructure, or
- a Market Data Provider.

#### USAGE

The request is sent when the instructing party identified that a security is wrongly created in the securities coverage of the executing/servicing party. The instructing party needs this security to be removed from the executing /servicing party database.

This message can be used when a security identification code was issued too quickly or if a security identification code needs to be reused (for example, in case of money market instrument). The result of this message is a complete removal of the security identification from the executing/servicing party's database.

Initiator: instructing party.

## **IntraPositionMovementQueryV01**

### **70.1      MessageDefinition Functionality**

The IntraPositionMovementQuery message is sent from an account owner/requestor to a settlement infrastructure to query intra-position movement instructions, along with their current status, based on a set of search criteria.

The message may also be used to:

- re-send a message sent by the account owner to the account servicer (the sub-function of the message is "Duplicate")
- provide a third party with a copy of a message being sent by the account owner for information (the sub-function of the message is "Copy")
- re-send to a third party a copy of a message being sent by the account owner for information (the sub-function of the message is "Copy Duplicate").

Outline

The IntraPositionMovementQueryV01 MessageDefinition is composed of 2 MessageBuildingBlocks:

A. QueryDefinition

Defines the intra-position movement instruction query criteria.

B. SupplementaryData

Additional information that cannot be captured in the structured elements and/or any other specific block.

## **IntraPositionMovementQueryResponseV01**

### **71.1    MessageDefinition Functionality**

The IntraPositionMovementQueryResponse message is sent from a settlement infrastructure to an account owner/requestor to provide all intra-position movement instructions satisfying the selection criteria, as defined within the query, returning current attributes and latest status.

The message may also be used to:

- re-send a message sent by the account owner to the account servicer (the sub-function of the message is "Duplicate")
- provide a third party with a copy of a message being sent by the account owner for information (the sub-function of the message is "Copy")
- re-send to a third party a copy of a message being sent by the account owner for information (the sub-function of the message is "Copy Duplicate").

#### **Outline**

The IntraPositionMovementQueryResponseV01 MessageDefinition is composed of 3 MessageBuildingBlocks:

- A. **Pagination**  
    Pagination of the message.
- B. **ReportGeneralDetails**  
    General characteristics related to the report information.
- C. **Movements**  
    Identifies the intra-position movements.

## 71.3 Constraints

### C1 AccountOwnerRule

AccountOwner must be present or Movement(\*)/AccountOwner must be present, but not both.

### C2 ActiveOrHistoricCurrency

The Currency Code must be registered, or have already been registered. Valid active or historic currency codes are registered with the ISO 4217 Maintenance Agency, consist of three (3) contiguous letters, and may be or not be withdrawn on the day the message containing the Currency is exchanged.

### C3 ActivityIndicatorNoRule

If ReportGeneralDetails/ActivityIndicator is equal to No (false or 0) then Movements must be absent.

*This constraint is defined at the MessageDefinition level.*

### C4 ActivityIndicatorYesRule

If ReportGeneralDetails/ActivityIndicator is equal to Yes (true or 1) then Movements must be present.

*This constraint is defined at the MessageDefinition level.*

### C5 AdditionalDetailsRule

Unless bilaterally agreed between the Sender and Receiver, if FinancialInstrumentAttributeAdditionalDetails is present, then it must not contain information that can be provided in a structured field.

### C6 AdditionalReasonInformationRule

The AdditionalReasonInformation element must not contain information that can be provided in a structured field unless bilaterally agreed.

### C7 AnyBIC

Only a valid Business identifier code is allowed. Business identifier codes for financial or non-financial institutions are registered and published by the ISO 9362 Registration Authority in the ISO directory of BICs, and consists of eight (8) or eleven (11) contiguous characters.

### C8 Country

The code is checked against the list of country names obtained from the United Nations (ISO 3166, Alpha-2 code).

### C9 DescriptionPresenceRule

If Description is not present then either ISIN or at least one occurrence of OtherIdentification must be present.

---

**C10 DescriptionUsageRule**

Description must be used alone as the last resort.

**C11 EventTypeRule**

The use of a specific corporate action event type code is allowed only if this specific event triggers a securities movement as per the Event Interpretation Grid published by the Securities Market Practice Group (SMPG).

The corporate action event indicator code OTHR must only be used in case no other corporate action event code is appropriate.

The corporate action event indicator code CHAN must only be used in case no other corporate action event code is appropriate and only for an event which relates to a change.

The corporate action event indicator code REDM must only be used when the redemption is decided by the issuer and not by the holders.

**C12 ISINGuideline**

When an ISIN code exists, it is strongly recommended that the ISIN be used.

**C13 ISINPresenceRule**

If ISIN is not present then either Description or at least one occurrence of OtherIdentification must be present.

**C14 NoAccountOwnerTransactionIdentificationRule**

If no reference is available for the AccountOwnerTransactionIdentification, for example, the transaction was sent by fax, then the AccountOwnerTransactionIdentification must be NONREF.

**C15 OtherIdentificationPresenceRule**

If OtherIdentification is not present then either ISIN or Description must be present.

**C16 PendingToFailingRule**

A pending transaction (PEND) becomes a failing transaction (PENF) on the settlement date instructed in the message, during the end of day reporting.

**C17 PlaceOfListingRule**

If PlaceOfListing is used and an ISO 10383 MIC exists for the market to be identified, the ISO 10383 Market Identifier Code (MIC) must be used.

**C18 QueryTypeFullRule**

If ReportGeneralDetails/QueryType is equal to Full, then Movements(\*)/Movement/MovementDetails must be present.

*This constraint is defined at the MessageDefinition level.*

**C19 QueryTypeStatusRule**

If ReportGeneralDetails/QueryType is equal to Status, then Movements(\*)/Movement/MovementDetails must be absent.

*This constraint is defined at the MessageDefinition level.*

#### C20 ReportIdentificationRule

If the report has multiple pages, then the ReportIdentification must remain the same through all the pages. It is a unique number to the report.

Two reports of the same type sent one after the other to the same receiver in relation to the same safekeeping account must have different report identifications. For example, a daily report sent on day 1 would have ReportIdentification 001, on day 2, 002, etc.

#### C21 SafekeepingAccountRule

SafekeepingAccount must be present or Movement(\*)/SafekeepingAccount must be present, but not both.

#### C22 ShortLongNumberRule

ShortNumber must contain the FIN message type number of the linked message. LongNumber must contain the XML message identifier of the linked message.

#### C23 StatusAndReasonRule

StatusAndReason must be present or Movement(\*)/StatusAndReason must be present, but not both.

#### C24 SupplementaryDataRule

This component may not be used without the explicit approval of a SEG and submission to the RA of ISO 20022 compliant structure(s) to be used in the Envelope element.

#### C25 WithLinkageRule

If Code WITH is used, then the one or more instruction which are linked become bound and which must be executed together. Even if one single transactions/instructions/notifications can not be executed, then all the other transactions/instructions/notifications must also be kept pending. Therefore the use of code WITH must be limited to combine up to 2 or 3 transactions/instructions/notifications.

## **SecuritiesSettlementConditionsModificationRequestQueryV01**

### **72.1    MessageDefinition Functionality**

The SecuritiesSettlementConditionsModificationRequestQuery message is sent from an account owner/requestor to a settlement infrastructure to query for the status of settlement or intra-position movement modification instruction(s) based on a set of search criteria or business attributes.

The message may also be used to:

- re-send a message sent by the account owner to the account servicer (the sub-function of the message is "Duplicate")
- provide a third party with a copy of a message being sent by the account owner for information (the sub-function of the message is "Copy")
- re-send to a third party a copy of a message being sent by the account owner for information (the sub-function of the message is "Copy Duplicate").

#### Outline

#### A. QueryDefinition

Defines the intra-position movement modification query criteria.

#### B. SupplementaryData

Additional information that cannot be captured in the structured elements and/or any other specific block.

## 76.3 Constraints

### C1 ActiveOrHistoricCurrency

The Currency Code must be registered, or have already been registered. Valid active or historic currency codes are registered with the ISO 4217 Maintenance Agency, consist of three (3) contiguous letters, and may be or not be withdrawn on the day the message containing the Currency is exchanged.

### C2 ActivityIndicatorNoRule

If ReportGeneralDetails/ActivityIndicator is equal to No (false or 0) then Movements must be absent.

---

*This constraint is defined at the MessageDefinition level.*

**C3 ActivityIndicatorYesRule**

If ReportGeneralDetails/ActivityIndicator is equal to Yes (true or 1) then Movements must be present.

*This constraint is defined at the MessageDefinition level.*

**C4 AdditionalDetailsRule**

Unless bilaterally agreed between the Sender and Receiver, if FinancialInstrumentAttributeAdditionalDetails is present, then it must not contain information that can be provided in a structured field.

**C5 AdditionalReasonInformationRule**

The AdditionalReasonInformation element must not contain information that can be provided in a structured field unless bilaterally agreed.

**C6 AnyBIC**

Only a valid Business identifier code is allowed. Business identifier codes for financial or non-financial institutions are registered and published by the ISO 9362 Registration Authority in the ISO directory of BICs, and consists of eight (8) or eleven (11) contiguous characters.

**C7 Country**

The code is checked against the list of country names obtained from the United Nations (ISO 3166, Alpha-2 code).

**C8 DescriptionPresenceRule**

If Description is not present then either ISIN or at least one occurrence of OtherIdentification must be present.

**C9 DescriptionUsageRule**

Description must be used alone as the last resort.

**C10 EventTypeRule**

The use of a specific corporate action event type code is allowed only if this specific event triggers a securities movement as per the Event Interpretation Grid published by the Securities Market Practice Group (SMPG).

The corporate action event indicator code OTHR must only be used in case no other corporate action event code is appropriate.

The corporate action event indicator code CHAN must only be used in case no other corporate action event code is appropriate and only for an event which relates to a change.

The corporate action event indicator code REDM must only be used when the redemption is decided by the issuer and not by the holders.

**C11 ISINGuideline**

When an ISIN code exists, it is strongly recommended that the ISIN be used.

**C12 ISINPresenceRule**

If ISIN is not present then either Description or at least one occurrence of OtherIdentification must be present.

---

**C13 NoAccountOwnerTransactionIdentificationRule**

If no reference is available for the AccountOwnerTransactionIdentification, for example, the transaction was sent by fax, then the AccountOwnerTransactionIdentification must be NONREF.

**C14 OtherIdentificationPresenceRule**

If OtherIdentification is not present then either ISIN or Description must be present.

**C15 PendingToFailingRule**

A pending transaction (PEND) becomes a failing transaction (PENF) on the settlement date instructed in the message, during the end of day reporting.

**C16 PlaceOfListingRule**

If PlaceOfListing is used and an ISO 10383 MIC exists for the market to be identified, the ISO 10383 Market Identifier Code (MIC) must be used.

**C17 ReportNumberRule**

If Long number (Exact5NumericTest) is used, then the report must be a delta reports (UpdateType: DELT).

If the report has multiple pages, then the ReportNumber must remain the same through all the pages. It is a unique number to the report.

Two reports of the same type sent one after the other to the same receiver in relation to the same safekeeping account must have different ReportNumbers. For example, a daily report sent on day 1 would have ReportNumber 001, on day 2, 002, etc.

**C18 ShortLongNumberRule**

ShortNumber must contain the FIN message type number of the linked message. LongNumber must contain the XML message identifier of the linked message.

**C19 StatusAndReasonRule**

StatusAndReason must be present or Movement(\*)/StatusAndReason must be present, but not both.

**C20 SupplementaryDataRule**

This component may not be used without the explicit approval of a SEG and submission to the RA of ISO 20022 compliant structure(s) to be used in the Envelope element.

**C21 WithLinkageRule**

If Code WITH is used, then the one or more instruction which are linked become bound and which must be executed together. Even if one single transactions/instructions/notifications can not be executed, then all the other transactions/instructions/notifications must also be kept pending. Therefore the use of code WITH must be limited to combine up to 2 or 3 transactions/instructions/notifications.

CodeName	Name	Definition

EXRI	CallOnIntermediateSecurities	Call or exercise on nil paid securities or intermediate securities resulting from an intermediate securities distribution (RHDI). This code is used for the second event, when an intermediate securities' issue (rights/coupons) is composed of two events, the first event being the distribution of intermediate securities.
CAPD	CapitalDistribution	Corporate event pays shareholders an amount in cash issued from the capital account. There is no reduction to the face value of a single share (or the share has no par value). The number of circulating shares remains unchanged.

They are contingent creditors of a company and hence may, in some instances, be entitled to vote on and be bound by a scheme of arrangement between the creditors and the company. As many options have multiple exercise periods a company option will either lapse or carry on to the next expiry date.

DRIP	DividendReinvestment	Dividend payment where holders can keep cash or have the cash reinvested in the market by the issuer into additional shares in the issuing company. To be distinguished from DVOP as the company invests the dividend in the market rather than creating new share capital in exchange for the dividend.
DRAW	Drawing	Securities are redeemed in part before the scheduled final maturity date. It is done without any pool factor reduction. The redemption is reflected in a debit of the face amount (FAMT). Drawing is distinct from partial call since drawn bonds are chosen by lottery. Therefore, not every holder is affected in the same way.

CodeName	Name	Definition
A001	IC30360ISDAor30360AmericanBasicRule	Method whereby interest is calculated based on a 30-day month and a 360-day year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month, except for February, and provided that the interest period started on a 30th or a 31st. This means that a 31st is assumed to be a 30th if the

CodeName	Name	Definition
		period started on a 30th or a 31st and the 28 Feb (or 29 Feb for a leap year) is assumed to be the 28th (or 29th). This is the most commonly used 30/360 method for US straight and convertible bonds.
A002	IC30365	Method whereby interest is calculated based on a 30-day month in a way similar to the 30/360 (basic rule) and a 365-day year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month, except for February. This means that a 31st is assumed to be the 30th and the 28 Feb (or 29 Feb for a leap year) is assumed to be the 28th (or 29th).
A003	IC30Actual	Method whereby interest is calculated based on a 30-day month in a way similar to the 30/360 (basic rule) and the assumed number of days in a year in a way similar to the Actual/Actual (ICMA). Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month, except for February. This means that the 31st is assumed to be the 30th and 28 Feb (or 29 Feb for a leap year) is assumed to be the 28th (or 29th). The assumed number of days in a year is computed as the actual number of days in the coupon period multiplied by the number of interest payments in the year.
A004	Actual360	Method whereby interest is calculated based on the actual number of accrued days in the interest period and a 360-day year.
A005	Actual365Fixed	Method whereby interest is calculated based on the actual number of accrued days in the interest period and a 365-day year.
A006	ActualActualICMA	Method whereby interest is calculated based on the actual number of accrued days and the assumed number of days in a year, that is, the actual number of days in the coupon period multiplied by the number of interest payments in the year. If the coupon period is irregular (first or last coupon), it is extended or split into quasi-interest periods that have the length of a regular coupon period and the computation is operated separately on each quasi-interest period and the intermediate results are summed up.
A007	IC30E360orEuroBondBasismodel1	Method whereby interest is calculated based on a 30-day month and a 360-day year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month. This means that the 31st is

CodeName	Name	Definition
		assumed to be the 30th and the 28 Feb (or 29 Feb for a leap year) is assumed to be equivalent to 30 Feb. However, if the last day of the maturity coupon period is the last day of February, it will not be assumed to be the 30th. It is a variation of the 30/360 (ICMA) method commonly used for eurobonds. The usage of this variation is only relevant when the coupon periods are scheduled to end on the last day of the month.
A008	ActualActualISDA	Method whereby interest is calculated based on the actual number of accrued days of the interest period that fall (falling on a normal year, year) divided by 365, added to the actual number of days of the interest period that fall (falling on a leap year, year) divided by 366.
A009	Actual365LorActuActubasisRule	Method whereby interest is calculated based on the actual number of accrued days and a 365-day year (if the coupon payment date is NOT in a leap year) or a 366-day year (if the coupon payment date is in a leap year).
A010	ActualActualAFB	Method whereby interest is calculated based on the actual number of accrued days and a 366-day year (if 29 Feb falls in the coupon period) or a 365-day year (if 29 Feb does not fall in the coupon period). If a coupon period is longer than one year, it is split by repetitively separating full year subperiods counting backwards from the end of the coupon period (a year backwards from 28 Feb being 29 Feb, if it exists). The first of the subperiods starts on the start date of the accrued interest period and thus is possibly shorter than a year. Then the interest computation is operated separately on each subperiod and the intermediate results are summed up.
A011	IC30360ICMAor30360basicrule	Method whereby interest is calculated based on a 30-day month and a 360-day year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month, except for February. This means that the 31st is assumed to be the 30th and 28 Feb (or 29 Feb for a leap year) is assumed to be the 28th (or 29th). It is the most commonly used 30/360 method for non-US straight and convertible bonds issued before 1 January 1999.
A012	IC30E2360orEurobondbasismodel2	Method whereby interest is calculated based on a 30-day month and a 360-day year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month, except for the last day of

CodeName	Name	Definition
		February whose day of the month value shall be adapted to the value of the first day of the interest period if the latter is higher and if the period is one of a regular schedule. This means that the 31st is assumed to be the 30th and 28 Feb of a non-leap year is assumed to be equivalent to 29 Feb when the first day of the interest period is the 29th, or to 30 Feb when the first day of the interest period is the 30th or the 31st. The 29th day of February in a leap year is assumed to be equivalent to 30 Feb when the first day of the interest period is the 30th or the 31st. Similarly, if the coupon period starts on the last day of February, it is assumed to produce only one day of interest in February as if it was starting on 30 Feb when the end of the period is the 30th or the 31st, or two days of interest in February when the end of the period is the 29th, or three days of interest in February when it is 28 Feb of a non-leap year and the end of the period is before the 29th.
A013	IC30E3360orEurobondbasismodel3	Method whereby interest is calculated based on a 30-day month and a 360-day year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month. This means that the 31st is assumed to be the 30th and 28 Feb (or 29 Feb for a leap year) is assumed to be equivalent to 30 Feb. It is a variation of the 30E/360 (or Eurobond basis) method where the last day of February is always assumed to be the 30th, even if it is the last day of the maturity coupon period.
A014	Actual365NL	Method whereby interest is calculated based on the actual number of accrued days in the interest period, excluding any leap day from the count, and a 365-day year.

### 77.2.2.63 InterestComputationMethod2Code

*Definition:* Specifies the method used to compute accruing interest of a financial instrument.

*Type:* CodeSet

CodeName	Name	Definition
A001	IC30360ISDAor30360AmericanBasicRule	Method whereby interest is calculated based on a 30-day month and a 360-day year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the

CodeName	Name	Definition
		same month, except for February, and provided that the interest period started on a 30th or a 31st. This means that a 31st is assumed to be a 30th if the period started on a 30th or a 31st and the 28 Feb (or 29 Feb for a leap year) is assumed to be the 28th (or 29th). This is the most commonly used 30/360 method for US straight and convertible bonds.
A002	IC30365	Method whereby interest is calculated based on a 30-day month in a way similar to the 30/360 (basic rule) and a 365-day year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month, except for February. This means that a 31st is assumed to be the 30th and the 28 Feb (or 29 Feb for a leap year) is assumed to be the 28th (or 29th).
A003	IC30Actual	Method whereby interest is calculated based on a 30-day month in a way similar to the 30/360 (basic rule) and the assumed number of days in a year in a way similar to the Actual/Actual (ICMA). Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month, except for February. This means that the 31st is assumed to be the 30th and 28 Feb (or 29 Feb for a leap year) is assumed to be the 28th (or 29th). The assumed number of days in a year is computed as the actual number of days in the coupon period multiplied by the number of interest payments in the year.
A004	Actual360	Method whereby interest is calculated based on the actual number of accrued days in the interest period and a 360-day year.
A005	Actual365Fixed	Method whereby interest is calculated based on the actual number of accrued days in the interest period and a 365-day year.
A006	ActualActualICMA	Method whereby interest is calculated based on the actual number of accrued days and the assumed number of days in a year, that is, the actual number of days in the coupon period multiplied by the number of interest payments in the year. If the coupon period is irregular (first or last coupon), it is extended or split into quasi-interest periods that have the length of a regular coupon period and the computation is operated separately on each quasi-interest period and the intermediate results are summed up.
A007	IC30E360orEuroBondBasismodel1	Method whereby interest is calculated based on a 30-day month and a 360-day

CodeName	Name	Definition
		year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month. This means that the 31st is assumed to be the 30th and the 28 Feb (or 29 Feb for a leap year) is assumed to be equivalent to 30 Feb. However, if the last day of the maturity coupon period is the last day of February, it will not be assumed to be the 30th. It is a variation of the 30/360 (ICMA) method commonly used for eurobonds. The usage of this variation is only relevant when the coupon periods are scheduled to end on the last day of the month.
A008	ActualActualISDA	Method whereby interest is calculated based on the actual number of accrued days of the interest period that fall (falling on a normal year, year) divided by 365, added to the actual number of days of the interest period that fall (falling on a leap year, year) divided by 366.
A009	Actual365LorActuActubasisRule	Method whereby interest is calculated based on the actual number of accrued days and a 365-day year (if the coupon payment date is NOT in a leap year) or a 366-day year (if the coupon payment date is in a leap year).
A010	ActualActualAFB	Method whereby interest is calculated based on the actual number of accrued days and a 366-day year (if 29 Feb falls in the coupon period) or a 365-day year (if 29 Feb does not fall in the coupon period). If a coupon period is longer than one year, it is split by repetitively separating full year subperiods counting backwards from the end of the coupon period (a year backwards from 28 Feb being 29 Feb, if it exists). The first of the subperiods starts on the start date of the accrued interest period and thus is possibly shorter than a year. Then the interest computation is operated separately on each subperiod and the intermediate results are summed up.
A011	IC30360ICMAor30360basicrule	Method whereby interest is calculated based on a 30-day month and a 360-day year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month, except for February. This means that the 31st is assumed to be the 30th and 28 Feb (or 29 Feb for a leap year) is assumed to be the 28th (or 29th). It is the most commonly used 30/360 method for non-US straight and convertible bonds issued before 1 January 1999.
A012	IC30E2360orEurobondbasismodel2	Method whereby interest is calculated based on a 30-day month and a 360-day

CodeName	Name	Definition
		year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month, except for the last day of February whose day of the month value shall be adapted to the value of the first day of the interest period if the latter is higher and if the period is one of a regular schedule. This means that the 31st is assumed to be the 30th and 28 Feb of a non-leap year is assumed to be equivalent to 29 Feb when the first day of the interest period is the 29th, or to 30 Feb when the first day of the interest period is the 30th or the 31st. The 29th day of February in a leap year is assumed to be equivalent to 30 Feb when the first day of the interest period is the 30th or the 31st. Similarly, if the coupon period starts on the last day of February, it is assumed to produce only one day of interest in February as if it was starting on 30 Feb when the end of the period is the 30th or the 31st, or two days of interest in February when the end of the period is the 29th, or three days of interest in February when it is 28 Feb of a non-leap year and the end of the period is before the 29th.
A013	IC30E3360orEurobondbasismodel3	Method whereby interest is calculated based on a 30-day month and a 360-day year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month. This means that the 31st is assumed to be the 30th and 28 Feb (or 29 Feb for a leap year) is assumed to be equivalent to 30 Feb. It is a variation of the 30E/360 (or Eurobond basis) method where the last day of February is always assumed to be the 30th, even if it is the last day of the maturity coupon period.
A014	Actual365NL	Method whereby interest is calculated based on the actual number of accrued days in the interest period, excluding any leap day from the count, and a 365-day year.
NARR	Narrative	Other method than A001-A020. See Narrative.
