| FLEX | Flex | Scenario, either by design or otherwise, that primarily tests the sensitivity of a portfolio of derivatives with a common underlying to differences in the valuation of such derivatives caused by differences in the maturity of such contracts. Typically, flex scenarios are aimed at stressing the valuation of portfolios that are insensitive to small movements in an underlying but sensitive to differences in the reaction of such portfolios in time space. For instance, calendar spreads or flattening or steeping positions in interest rate space. |
| PRLL | Parallel | Scenario, either by design or otherwise, that primarily tests the sensitivity of a portfolio of derivatives to changes in the value of a common underlying. For example as parallel shift of an interest rate curve. |
| SPRD | Spread | Scenario, either by design or otherwise, that primarily tests the sensitivity of a portfolio of derivatives with differing, but correlated underlyings. Typically, spread scenarios are aimed at stressing the valuation of portfolios that are insensitive to small co-movements in a set of underlyings but sensitive to differences in the reaction of such portfolios to breakdowns in historical correlations or covariance. |

CCPIncomeStatementAndCapitalAdequacyReportV02

7.1 **MessageDefinition Functionality**

The CCPIncomeStatementAndCapitalAdequacyReport message is sent from the central counterparty to the national competent authority. It is used to inform the national competent authority about the financial performance and regulatory capital holdings of the central counterparty.

V02 adds a clearing member id to break down the ClrFees by the clearing member from whom the fee income is being received. The change is motivated by a supervisory need to understand from which jurisdictions clearing fees are paid to the CCP.

Outline

The CCPIncomeStatementAndCapitalAdequacyReportV02 MessageDefinition is composed of 6 MessageBuildingBlocks:

- A. IncomeStatement
Income statement of the CCP.
- B. CapitalRequirements
Report of the breakdown of the components for the capital requirement for central counterparty.
- C. TotalCapital
Sum of the CCP's capital requirements for operational expenses; for winding down or restructuring its activities; for overall operational and legal risk; for uncovered credit, counterparty credit and market risks and business risks.
- D. LiquidFinancialResources
Total capital resources invested in liquid financial resources.
- E. HypotheticalCapitalMeasure
Hypothetical capital requirement due to counterparty credit risk exposures to all clearing members.
- F. SupplementaryData
Additional information that cannot be captured in the structured elements and/or any other specific block.

11.3 Constraints

C1 ActiveCurrency

The currency code must be a valid active currency code, not yet withdrawn on the day the message containing the currency is exchanged. Valid active currency codes are registered with the ISO 4217 Maintenance Agency, consist of three (3) contiguous letters, and are not yet withdrawn on the day the message containing the Currency is exchanged.

C2 CurrencyAmount

The number of fractional digits (or minor unit of currency) must comply with ISO 4217.

Note: The decimal separator is a dot.

C3 LiquidityHorizonRule

In each iteration, the value of LiquidityHorizon must be different.

C4 SupplementaryDataRule

This component may not be used without the explicit approval of a SEG and submission to the RA of ISO 20022 compliant structure(s) to be used in the Envelope element.

12 auth.064.001.02 CCPAvailableFinancialResourcesReportV02

12.1 MessageDefinition Functionality

The CCPAvailableFinancialResourcesReport message is sent from the central counterparty to the national competent authority. It is used to inform the national competent authority of the aggregate quantum of resources available in each default waterfall to absorb losses resulting from the failure of one or more clearing member(s).

V02 amends the reporting asset types to be consistent across the scope of CCP Supervisory Reporting data collection.

Outline

The CCPAvailableFinancialResourcesReportV02 MessageDefinition is composed of 3 MessageBuildingBlocks:

A. AvailableFinancialResourcesAmount

Construct used by a central counterparty to define the size of the aggregate quantum of resources available from a clearing member.

B. OtherPrefundedResources

Breakdown of other CCP prefunded resources required as part of the default waterfall.

C. SupplementaryData

Additional information that cannot be captured in the structured elements and/or any other specific block.

18.1 MessageDefinition Functionality

The CCPInteroperabilityReport message is sent from the central counterparty to the national competent authority. It is an optional report only to be sent if the central counterparty offers an interoperability arrangement with another CCP. It informs the national competent authority about the usage of the linked CCPs in terms of the exposures, margin calls and collateral from the interoperable CCP to the reporting CCP.

Outline

The CCPInteroperabilityReportV01 MessageDefinition is composed of 2 MessageBuildingBlocks:

| A001 | IC30360ISDAor30360AmericanBasicRule | Method whereby interest is calculated based on a 30-day month and a 360-day year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month, except for February, and provided that the interest period started on a 30th or a 31st. This means that a 31st is assumed to be a 30th if the period started on a 30th or a 31st and the 28 Feb (or 29 Feb for a leap year) is assumed to be the 28th (or 29th). This is the most commonly used 30/360 method for US straight and convertible bonds. |
| A002 | IC30365 | Method whereby interest is calculated based on a 30-day month in a way similar to the 30/360 (basic rule) and a 365-day year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month, except for February. | | | (or 29 Feb for a leap year) is assumed to be the 28th (or 29th). |
| A003 | IC30Actual | Method whereby interest is calculated based on a 30-day month in a way similar to the 30/360 (basic rule) and the assumed number of days in a year in a way similar to the Actual/Actual (ICMA). Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month, except for February. This means that the 31st is assumed to be the 30th and 28 Feb (or 29 Feb for a leap year) is assumed to be the 28th (or 29th). The assumed number of days in a year is computed as the actual number of days in the coupon period multiplied by the number of interest payments in the year. |
| A004 | Actual360 | Method whereby interest is calculated based on the actual number of accrued days in the interest period and a 360-day year. |
| A005 | Actual365Fixed | Method whereby interest is calculated based on the actual number of accrued days in the interest period and a 365-day year. |
| A006 | ActualActualICMA | Method whereby interest is calculated based on the actual number of accrued days and the assumed number of days in a year, that is, the actual number of days in the coupon period multiplied by the number of interest payments in the year. If the coupon period is irregular (first or last coupon), it is extended or split into quasi-interest periods that have the length of a regular coupon period and the computation is operated separately on each quasi-interest period and the intermediate results are summed up. |
| A007 | IC30E360orEuroBondBasismodel1 | Method whereby interest is calculated based on a 30-day month and a 360-day year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month. This means that the 31st is assumed to be the 30th and the 28 Feb (or 29 Feb for a leap year) is assumed to be equivalent to 30 Feb. However, if the last day of the maturity coupon period is the last day of February, it will not be assumed to be the 30th. It is a variation of the 30/360 (ICMA) method commonly used for eurobonds. The usage of this variation is only relevant when the coupon periods are scheduled to end on the last day of the month. |

| A009 | Actual365LorActuActubasisRule | Method whereby interest is calculated based on the actual number of accrued days and a 365-day year (if the coupon payment date is NOT in a leap year) or a 366-day year (if the coupon payment date is in a leap year). |
| A010 | ActualActualAFB | Method whereby interest is calculated based on the actual number of accrued days and a 366-day year (if 29 Feb falls in the coupon period) or a 365-day year (if 29 Feb does not fall in the coupon period). If a coupon period is longer than one year, it is split by repetitively separating full year subperiods counting backwards from the end of the coupon period (a year backwards from 28 Feb being 29 Feb, if it exists). The first of the subperiods starts on the start date of the accrued interest period and thus is possibly shorter than a year. Then the interest computation is operated separately on each subperiod and the intermediate results are summed up. |
| A011 | IC30360ICMAor30360basicrule | Method whereby interest is calculated based on a 30-day month and a 360-day year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month, except for February. This means that the 31st is assumed to be the 30th and 28 Feb (or 29 Feb for a leap year) is assumed to be the 28th (or 29th). It is the most commonly used 30/360 method for non-US straight and convertible bonds issued before 1 January 1999. |
| A012 | IC30E2360orEurobondbasismodel2 | Method whereby interest is calculated based on a 30-day month and a 360-day year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month, except for the last day of February whose day of the month value shall be adapted to the value of the first day of the interest period if the latter is higher and if the period is one of a regular schedule. This means that the 31st is assumed to be the 30th and 28 Feb of a non-leap year is assumed to be equivalent to 29 Feb when the first day of the interest period is the 29th, or to 30 Feb when the first day of the interest period is the 30th or the 31st. The 29th day of February in a leap year is assumed to be equivalent to 30 Feb when the first day of the interest period is the 30th or the 31st. Similarly, if the |

| | | coupon period starts on the last day of February, it is assumed to produce only one day of interest in February as if it was starting on 30 Feb when the end of the period is the 30th or the 31st, or two days of interest in February when the end of the period is the 29th, or three days of interest in February when it is 28 Feb of a non-leap year and the end of the period is before the 29th. |
| A013 | IC30E3360orEurobondbasismodel3 | Method whereby interest is calculated based on a 30-day month and a 360-day year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month. This means that the 31st is assumed to be the 30th and 28 Feb (or 29 Feb for a leap year) is assumed to be equivalent to 30 Feb. It is a variation of the 30E/360 (or Eurobond basis) method where the last day of February is always assumed to be the 30th, even if it is the last day of the maturity coupon period. |
| A014 | Actual365NL | Method whereby interest is calculated based on the actual number of accrued days in the interest period, excluding any leap day from the count, and a 365-day year. |
| NARR | Narrative | Other method than A001-A020. See Narrative. |

|----------|-------------------------------------|---|
| A001 | IC30360ISDAor30360AmericanBasicRule | Method whereby interest is calculated based on a 30-day month and a 360-day |

| | | year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month, except for February, and provided that the interest period started on a 30th or a 31st. This means that a 31st is assumed to be a 30th if the period started on a 30th or a 31st and the 28 Feb (or 29 Feb for a leap year) is assumed to be the 28th (or 29th). This is the most commonly used 30/360 method for US straight and convertible bonds. |
| A002 | IC30365 | Method whereby interest is calculated based on a 30-day month in a way similar to the 30/360 (basic rule) and a 365-day year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month, except for February. This means that a 31st is assumed to be the 30th and the 28 Feb (or 29 Feb for a leap year) is assumed to be the 28th (or 29th). |
| A003 | IC30Actual | Method whereby interest is calculated based on a 30-day month in a way similar to the 30/360 (basic rule) and the assumed number of days in a year in a way similar to the Actual/Actual (ICMA). Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month, except for February. This means that the 31st is assumed to be the 30th and 28 Feb (or 29 Feb for a leap year) is assumed to be the 28th (or 29th). The assumed number of days in a year is computed as the actual number of days in the coupon period multiplied by the number of interest payments in the year. |
| A004 | Actual360 | Method whereby interest is calculated based on the actual number of accrued days in the interest period and a 360-day year. |
| A005 | Actual365Fixed | Method whereby interest is calculated based on the actual number of accrued days in the interest period and a 365-day year. |
| A006 | ActualActualICMA | Method whereby interest is calculated based on the actual number of accrued days and the assumed number of days in a year, that is, the actual number of days in the coupon period multiplied by the number of interest payments in the year. If the coupon period is irregular (first or last coupon), it is extended or split into quasi-interest periods that have the length of a regular coupon period and the computation is operated separately on each quasi-interest period |

| CodeName | Name | Definition |
|----------|-------------------------------|---|
| | | and the intermediate results are summed up. |
| A007 | IC30E360orEuroBondBasismodel1 | Method whereby interest is calculated based on a 30-day month and a 360-day year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month. This means that the 31st is assumed to be the 30th and the 28 Feb (or 29 Feb for a leap year) is assumed to be equivalent to 30 Feb. However, if the last day of the maturity coupon period is the last day of February, it will not be assumed to be the 30th. It is a variation of the 30/360 (ICMA) method commonly used for eurobonds. The usage of this variation is only relevant when the coupon periods are scheduled to end on the last day of the month. |
| A008 | ActualActualISDA | Method whereby interest is calculated based on the actual number of accrued days of the interest period that fall (falling on a normal year, year) divided by 365, added to the actual number of days of the interest period that fall (falling on a leap year, year) divided by 366. |
| A009 | Actual365LorActuActubasisRule | Method whereby interest is calculated based on the actual number of accrued days and a 365-day year (if the coupon payment date is NOT in a leap year) or a 366-day year (if the coupon payment date is in a leap year). |
| A010 | ActualActualAFB | Method whereby interest is calculated based on the actual number of accrued days and a 366-day year (if 29 Feb falls in the coupon period) or a 365-day year (if 29 Feb does not fall in the coupon period). If a coupon period is longer than one year, it is split by repetitively separating full year subperiods counting backwards from the end of the coupon period (a year backwards from 28 Feb being 29 Feb, if it exists). The first of the subperiods starts on the start date of the accrued interest period and thus is possibly shorter than a year. Then the interest computation is operated separately on each subperiod and the intermediate results are summed up. |
| A011 | IC30360ICMAor30360basicrule | Method whereby interest is calculated based on a 30-day month and a 360-day year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month, except for February. This means that the 31st is assumed to be the 30th and 28 Feb (or 29 Feb for a leap year) is assumed to be the 28th (or 29th). It is the most commonly used 30/360 method for non-US straight and |

| CodeName | Name | Definition |
|----------|--------------------------------|---|
| | | convertible bonds issued before 1 January 1999. |
| A012 | IC30E2360orEurobondbasismodel2 | Method whereby interest is calculated based on a 30-day month and a 360-day year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month, except for the last day of February whose day of the month value shall be adapted to the value of the first day of the interest period if the latter is higher and if the period is one of a regular schedule. This means that the 31st is assumed to be the 30th and 28 Feb of a non-leap year is assumed to be equivalent to 29 Feb when the first day of the interest period is the 29th, or to 30 Feb when the first day of the interest period is the 30th or the 31st. The 29th day of February in a leap year is assumed to be equivalent to 30 Feb when the first day of the interest period is the 30th or the 31st. Similarly, if the coupon period starts on the last day of February, it is assumed to produce only one day of interest in February as if it was starting on 30 Feb when the end of the period is the 30th or the 31st, or two days of interest in February when the end of the period is the 29th, or three days of interest in February when it is 28 Feb of a non-leap year and the end of the period is before the 29th. |
| A013 | IC30E3360orEurobondbasismodel3 | Method whereby interest is calculated based on a 30-day month and a 360-day year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month. This means that the 31st is assumed to be the 30th and 28 Feb (or 29 Feb for a leap year) is assumed to be equivalent to 30 Feb. It is a variation of the 30E/360 (or Eurobond basis) method where the last day of February is always assumed to be the 30th, even if it is the last day of the maturity coupon period. |
| A014 | Actual365NL | Method whereby interest is calculated based on the actual number of accrued days in the interest period, excluding any leap day from the count, and a 365-day year. |
| NARR | Narrative | Other method than A001-A020. See Narrative. |
