SecurityQueryV01

31.1 MessageDefinition Functionality

SCOPE

An instructing party sends a SecurityQuery message to an executing/servicing party to request a report of financial instrument details in their system.

The instructing party - executing/servicing party relationship may be:

- Central Securities Depositories (CSD) who would like to publish security static data, or
- a Corporate, or
- a Bank, or
- a Market Infrastructure, or
- a Market Data Provider.

USAGE

The request is sent when the instructing party needs to see data of a security data within the executing/servicing party system.

Initiator: instructing party.

Outline

The SecurityQueryV01 MessageDefinition is composed of 5 MessageBuildingBlocks:

- A. MessageHeader
 - Common business identification for the message.
- B. RequestType
 - Defines the type of action to be performed in the request.
- C. SearchCriteria
 - Defines the criteria to be used to query the securities reference data by the executing system.
- D. SmallSetReturnCriteria
 - Defines the expected securities reference data to be returned.
- E. SupplementaryData
 - Additional information that cannot be captured in the structured elements and/or any other specific block.

32.3 Constraints

C1 ActiveCurrency

The currency code must be a valid active currency code, not yet withdrawn on the day the message containing the currency is exchanged. Valid active currency codes are registered with the ISO 4217 Maintenance Agency, consist of three (3) contiguous letters, and are not yet withdrawn on the day the message containing the Currency is exchanged.

C2 ActiveOrHistoricCurrency

C5 CurrencyAmount

The number of fractional digits (or minor unit of currency) must comply with ISO 4217.

Note: The decimal separator is a dot.

C6 DescriptionPresenceRule

If Description is not present then either ISIN or at least one occurrence of OtherIdentification must be present.

C7 DescriptionUsageRule

Description must be used alone as the last resort.

C8 ISINGuideline

When an ISIN code exists, it is strongly recommended that the ISIN be used.

C9 ISINPresenceRule

If ISIN is not present then either Description or at least one occurrence of OtherIdentification must be present.

C10 MailingIndicatorRule

If RegistrationAddressIndicator is "true" or "1" (Yes), then MailingIndicator must be "true" or "1".

C11 NextCallableDateAndCallableIndicatorRule

If CallableIndicator is present, then NextCalldate must be present.

C12 OtherIdentificationPresenceRule

If OtherIdentification is not present then either ISIN or Description must be present.

C13 PutableDateAndPutableIndicatorRule

If PutableIndicator is present, then PutableDate must be present.

C14 SupplementaryDataRule

This component may not be used without the explicit approval of a SEG and submission to the RA of ISO 20022 compliant structure(s) to be used in the Envelope element.

33 reda.013.001.01 SecurityDeletionRequestV01

33.1 MessageDefinition Functionality

SCOPE

An instructing party sends a SecurityDeletionRequest message to an executing/servicing party to advise the complete removal of a financial instrument entry from their system.

The instructing party - executing/servicing party relationship may be:

- Central Securities Depositories (CSD) who would like to publish security static data, or
- a Corporate, or
- a Bank, or
- a Market Infrastructure, or
- a Market Data Provider.

USAGE

The request is sent when the instructing party identified that a security is wrongly created in the securities coverage of the executing/servicing party. The instructing party needs this security to be removed from the executing /servicing party database.

This message can be used when a security identification code was issued too quickly or if a security identification code needs to be reused (for example, in case of money market instrument). The result of this message is a complete removal of the security identification from the executing/servicing party's database.

Initiator: instructing party.

71.3 Constraints

C1 **ActiveCurrency**

The currency code must be a valid active currency code, not yet withdrawn on the day the message containing the currency is exchanged. Valid active currency codes are registered with the ISO 4217 Maintenance Agency, consist of three (3) contiguous letters, and are not yet withdrawn on the day the message containing the Currency is exchanged.

C2 **ActiveOrHistoricCurrency**

The Currency Code must be registered, or have already been registered. Valid active or historic currency codes are registered with the ISO 4217 Maintenance Agency, consist of three (3) contiguous letters, and may be or not be withdrawn on the day the message containing the Currency is exchanged.

C3 **AdditionalReasonInformationRule**

The AdditionalReasonInformation element must not contain information that can be provided in a structured field unless bilaterally agreed.

C4 **AnyBIC**

Only a valid Business identifier code is allowed. Business identifier codes for financial or non-financial institutions are registered and published by the ISO 9362 Registration Authority in the ISO directory of BICs, and consists of eight (8) or eleven (11) contiguous characters.

C6 **DescriptionPresenceRule**

If Description is not present then either ISIN or at least one occurrence of OtherIdentification must be present.

C7 **DescriptionUsageRule**

Description must be used alone as the last resort.

C8 **IBAN**

A valid IBAN consists of all three of the following components: Country Code, check digits and BBAN.

C9 **ISINGuideline**

When an ISIN code exists, it is strongly recommended that the ISIN be used.

C10 **ISINPresenceRule**

If ISIN is not present then either Description or at least one occurrence of OtherIdentification must be present.

C11 **OtherIdentificationPresenceRule**

If OtherIdentification is not present then either ISIN or Description must be present.

C12 **Party2PresenceRule**

If Party2 is present, then Party1 must be present.

C13 Party3PresenceRule

If Party3 is present, then Party2 must be present.

C14 Party4PresenceRule

If Party4 is present, then Party3 must be present.

C15 Party5PresenceRule

If Party5 is present, then Party4 must be present.

C16 SupplementaryDataRule

This component may not be used without the explicit approval of a SEG and submission to the RA of ISO 20022 compliant structure(s) to be used in the Envelope element.

C10 CurrencyAmount

The number of fractional digits (or minor unit of currency) must comply with ISO 4217.

Note: The decimal separator is a dot.

C11 DescriptionPresenceRule

If Description is not present then either ISIN or at least one occurrence of OtherIdentification must be present.

C12 DescriptionUsageRule

Description must be used alone as the last resort.

C13 EventTypeRule

The use of a specific corporate action event type code is allowed only if this specific event triggers a securities movement as per the Event Interpretation Grid published by the Securities Market Practice Group (SMPG).

The corporate action event indicator code OTHR must only be used in case no other corporate action event code is appropriate.

C26 PendingToFailingRule

A pending transaction (PEND) becomes a failing transaction (PENF) on the settlement date instructed in the message, during the end of day reporting.

C27 PostingAmountRule

If the instruction is against payment, PostingAmount must be present.

C28 QueryTypeAndStatusReasonRule

If QueryType is equal to Status (STTS) or StatusPeriod (STPD) then Transactions(*)/StatusReason must be present.

This constraint is defined at the MessageDefinition level.

C29 ReportIdentificationRule

If Long number (Exact5NumericText) is used, then the report must be a delta reports (UpdateType: DELT).

If the report has multiple pages, then the ReportIdentification must remain the same through all the pages. It is a unique number to the report.

Two reports of the same type sent one after the other to the same receiver in relation to the same safekeeping account must have different report identifications. For example, a daily report sent on day 1 would have ReportIdentification 001, on day 2, 002, etc.

C33 SettlementParametersGuideline

- Physical settlement:

In case of physical receipt at local agent level, the receiving agent must receive a receipt free instruction

for reconciliation purposes. If the final beneficiary of the securities uses a global custodian, the receipt free

instruction will be sent to the global custodian that will forward it to his receiving agent on the market.

For physical settlement, SettlementTransactionCondition/Physical must be used.

- Partial settlement:

This market practice only applies in markets where partial settlement is allowed.

If an account owner wants to specify in its original instruction that partial settlement is allowed or not, they

must use the PartialSettlementIndicator.

- Book Transfer:

The use of SecuritiesTransactionTypes OWNI, OWNE, INSP and PORT and other booktransfer related fields is governed by a market practice document.

- Block Trades:

The parent transaction must be identified using the BlocTrade field with code BLPA. The children

transactions must be identified using the code BLCH.

For more details, see the relevant market practice document on www.smpg.info.

C34 SettlementStatusAndMatchedRule

If SettlementStatus/Reason is used alone, then it means that the transaction is matched (if a matching process exists in the concerned market or at the concerned account servicer).

C35 ShortLongNumberRule

ShortNumber must contain the FIN message type number of the linked message. LongNumber must contain the XML message identifier of the linked message.

C36 SupplementaryDataRule

This component may not be used without the explicit approval of a SEG and submission to the RA of ISO 20022 compliant structure(s) to be used in the Envelope element.

C37 TwoLegTransactionOpeningClosing1Rule

For settlement of two parts transactions (Securities Financing), the opening/initiation and closing/return of the transaction is confirmed by sending the below combination of SecuritiesMovementType codes and SettlementParameters/SecuritiesTransactionType codes:

C39 WithLinkageRule

If Code WITH is used, then the one or more instruction which are linked become bound and which must be executed together. Even if one single transactions/instructions/notifications can not be executed, then all the other transactions/instructions/notifications must also be kept pending. Therefore the use of code WITH must be limited to combine up to 2 or 3 transactions/instructions/notifications.

72.4 Message Building Blocks

This chapter describes the MessageBuildingBlocks of this MessageDefinition.

Constraints

- **ReportIdentificationRule**

If Long number (Exact5NumericText) is used, then the report must be a delta reports (UpdateType: DELT).

If the report has multiple pages, then the ReportIdentification must remain the same through all the pages. It is a unique number to the report.

Two reports of the same type sent one after the other to the same receiver in relation to the same safekeeping account must have different report identifications. For example, a daily report sent on day 1 would have ReportIdentification 001, on day 2, 002, etc.

72.4.2.1 ReportIdentification <RptId>

Presence: [0..1]

Definition: Reference common to all pages of a report.

Datatype: "Max35Text" on page 3328

72.4.2.2 QueryReference <QryRef>

Presence: [0..1]

72.4.2.3 QueryType <QryTp>

Presence: [1..1]

Definition: Defines the type of query.

Datatype: "SettlementQueryType1Code" on page 3300

CodeName	Name	Definition
INST	Instruction	Queries settlement instructions based on criteria excluding statuses.

- **FXStandingInstructionPresenceRule**

If HoldIndicator is present and is value TRUE (Yes), then FXStandingInstruction must not be present. In ISO 15022,

- **SettlementDetailsRule**

If SettlementDetails elements are used, then their conditions of use must be pre-agreed between account owner and account servicer.

- **SettlementParametersGuideline**

- Physical settlement:

In case of physical receipt at local agent level, the receiving agent must receive a receipt free instruction

for reconciliation purposes. If the final beneficiary of the securities uses a global custodian, the receipt free

instruction will be sent to the global custodian that will forward it to his receiving agent on the market.

For physical settlement, SettlementTransactionCondition/Physical must be used.

- Partial settlement:

This market practice only applies in markets where partial settlement is allowed.

If an account owner wants to specify in its original instruction that partial settlement is allowed or not, they

must use the PartialSettlementIndicator.

- Book Transfer:

The use of SecuritiesTransactionTypes OWNI, OWNE, INSP and PORT and other booktransfer related fields is governed by a market practice document.

- Block Trades:

The parent transaction must be identified using the BlocTrade field with code BLPA. The children

transactions must be identified using the code BLCH.

For more details, see the relevant market practice document on www.smpg.info.

73 semt.028.001.01 IntraPositionMovementQueryV01

73.1 MessageDefinition Functionality

The IntraPositionMovementQuery message is sent from an account owner/requestor to a settlement infrastructure to query intra-position movement instructions, along with their current status, based on a set of search criteria.

The message may also be used to:

- re-send a message sent by the account owner to the account servicer (the sub-function of the message is "Duplicate")
- provide a third party with a copy of a message being sent by the account owner for information (the sub-function of the message is "Copy")
- re-send to a third party a copy of a message being sent by the account owner for information (the sub-function of the message is "Copy Duplicate").

Outline

The IntraPositionMovementQueryV01 MessageDefinition is composed of 2 MessageBuildingBlocks:

A. QueryDefinition

Defines the intra-position movement instruction query criteria.

B. SupplementaryData

Additional information that cannot be captured in the structured elements and/or any other specific block.

IntraPositionMovementQueryResponseV01

74.1 MessageDefinition Functionality

The IntraPositionMovementQueryResponse message is sent from a settlement infrastructure to an account owner/requestor to provide all intra-position movement instructions satisfying the selection criteria, as defined within the query, returning current attributes and latest status.

The message may also be used to:

- re-send a message sent by the account owner to the account servicer (the sub-function of the message is "Duplicate")
- provide a third party with a copy of a message being sent by the account owner for information (the sub-function of the message is "Copy")
- re-send to a third party a copy of a message being sent by the account owner for information (the sub-function of the message is "Copy Duplicate").

Outline

The IntraPositionMovementQueryResponseV01 MessageDefinition is composed of 3 MessageBuildingBlocks:

- A. **Pagination**
 Pagination of the message.
- B. **ReportGeneralDetails**
 General characteristics related to the report information.
- C. **Movements**
 Identifies the intra-position movements.

74.3 Constraints

C1 AccountOwnerRule

AccountOwner must be present or Movement(*)/AccountOwner must be present, but not both.

C2 ActiveOrHistoricCurrency

The Currency Code must be registered, or have already been registered. Valid active or historic currency codes are registered with the ISO 4217 Maintenance Agency, consist of three (3) contiguous letters, and may be or not be withdrawn on the day the message containing the Currency is exchanged.

C3 ActivityIndicatorNoRule

If ReportGeneralDetails/ActivityIndicator is equal to No (false or 0) then Movements must be absent.

This constraint is defined at the MessageDefinition level.

C4 ActivityIndicatorYesRule

If ReportGeneralDetails/ActivityIndicator is equal to Yes (true or 1) then Movements must be present.

This constraint is defined at the MessageDefinition level.

C5 AdditionalDetailsRule

Unless bilaterally agreed between the Sender and Receiver, if FinancialInstrumentAttributeAdditionalDetails is present, then it must not contain information that can be provided in a structured field.

C6 AdditionalReasonInformationRule

The AdditionalReasonInformation element must not contain information that can be provided in a structured field unless bilaterally agreed.

C7 AnyBIC

Only a valid Business identifier code is allowed. Business identifier codes for financial or non-financial institutions are registered and published by the ISO 9362 Registration Authority in the ISO directory of BICs, and consists of eight (8) or eleven (11) contiguous characters.

C8 Country

The code is checked against the list of country names obtained from the United Nations (ISO 3166, Alpha-2 code).

C9 DescriptionPresenceRule

If Description is not present then either ISIN or at least one occurrence of OtherIdentification must be present.

C10 DescriptionUsageRule

Description must be used alone as the last resort.

C11 EventTypeRule

The use of a specific corporate action event type code is allowed only if this specific event triggers a securities movement as per the Event Interpretation Grid published by the Securities Market Practice Group (SMPG).

The corporate action event indicator code OTHR must only be used in case no other corporate action event code is appropriate.

The corporate action event indicator code CHAN must only be used in case no other corporate action event code is appropriate and only for an event which relates to a change.

The corporate action event indicator code REDM must only be used when the redemption is decided by the issuer and not by the holders.

C12 ISINGuideline

When an ISIN code exists, it is strongly recommended that the ISIN be used.

C13 ISINPresenceRule

If ISIN is not present then either Description or at least one occurrence of OtherIdentification must be present.

C14 NoAccountOwnerTransactionIdentificationRule

If no reference is available for the AccountOwnerTransactionIdentification, for example, the transaction was sent by fax, then the AccountOwnerTransactionIdentification must be NONREF.

C15 OtherIdentificationPresenceRule

If OtherIdentification is not present then either ISIN or Description must be present.

C16 PendingToFailingRule

A pending transaction (PEND) becomes a failing transaction (PENF) on the settlement date instructed in the message, during the end of day reporting.

C17 PlaceOfListingRule

If PlaceOfListing is used and an ISO 10383 MIC exists for the market to be identified, the ISO 10383 Market Identifier Code (MIC) must be used.

C18 QueryTypeFullRule

If ReportGeneralDetails/QueryType is equal to Full, then Movements(*)/Movement/MovementDetails must be present.

This constraint is defined at the MessageDefinition level.

C19 QueryTypeStatusRule

If ReportGeneralDetails/QueryType is equal to Status, then Movements(*)/Movement/MovementDetails must be absent.

This constraint is defined at the MessageDefinition level.

C20 ReportIdentificationRule

If the report has multiple pages, then the ReportIdentification must remain the same through all the pages. It is a unique number to the report.

Two reports of the same type sent one after the other to the same receiver in relation to the same safekeeping account must have different report identifications. For example, a daily report sent on day 1 would have ReportIdentification 001, on day 2, 002, etc.

C21 SafekeepingAccountRule

SafekeepingAccount must be present or Movement(*)/SafekeepingAccount must be present, but not both.

C22 ShortLongNumberRule

ShortNumber must contain the FIN message type number of the linked message. LongNumber must contain the XML message identifier of the linked message.

C23 StatusAndReasonRule

StatusAndReason must be present or Movement(*)/StatusAndReason must be present, but not both.

C24 SupplementaryDataRule

This component may not be used without the explicit approval of a SEG and submission to the RA of ISO 20022 compliant structure(s) to be used in the Envelope element.

C25 WithLinkageRule

If Code WITH is used, then the one or more instruction which are linked become bound and which must be executed together. Even if one single transactions/instructions/notifications can not be executed, then all the other transactions/instructions/notifications must also be kept pending. Therefore the use of code WITH must be limited to combine up to 2 or 3 transactions/instructions/notifications.

76.3 Constraints

C1 AccountOwnerRule

AccountOwner must be present or Modification(*)/AccountOwner must be present, but not both.

C2 ActiveCurrency

The currency code must be a valid active currency code, not yet withdrawn on the day the message containing the currency is exchanged. Valid active currency codes are registered with the ISO 4217 Maintenance Agency, consist of three (3) contiguous letters, and are not yet withdrawn on the day the message containing the Currency is exchanged.

C3 ActiveOrHistoricCurrency

The Currency Code must be registered, or have already been registered. Valid active or historic currency codes are registered with the ISO 4217 Maintenance Agency, consist of three (3) contiguous letters, and may be or not be withdrawn on the day the message containing the Currency is exchanged.

C4 ActivityIndicatorNoRule

If ReportGeneralDetails/ActivityIndicator is equal to No (false or 0) then Modifications must be absent.

This constraint is defined at the MessageDefinition level.

C5 ActivityIndicatorYesRule

If ReportGeneralDetails/ActivityIndicator is equal to Yes (true or 1) then Modifications must be present.

This constraint is defined at the MessageDefinition level.

C6 AdditionalReasonInformationRule

The AdditionalReasonInformation element must not contain information that can be provided in a structured field unless bilaterally agreed.

79.3 Constraints

C1 ActiveOrHistoricCurrency

The Currency Code must be registered, or have already been registered. Valid active or historic currency codes are registered with the ISO 4217 Maintenance Agency, consist of three (3) contiguous letters, and may be or not be withdrawn on the day the message containing the Currency is exchanged.

C2 ActivityIndicatorNoRule

If ReportGeneralDetails/ActivityIndicator is equal to No (false or 0) then Movements must be absent.

This constraint is defined at the MessageDefinition level.

C3 ActivityIndicatorYesRule

If ReportGeneralDetails/ActivityIndicator is equal to Yes (true or 1) then Movements must be present.

This constraint is defined at the MessageDefinition level.

C4 AdditionalDetailsRule

Unless bilaterally agreed between the Sender and Receiver, if FinancialInstrumentAttributeAdditionalDetails is present, then it must not contain information that can be provided in a structured field.

C5 AdditionalReasonInformationRule

The AdditionalReasonInformation element must not contain information that can be provided in a structured field unless bilaterally agreed.

C6 AnyBIC

Only a valid Business identifier code is allowed. Business identifier codes for financial or non-financial institutions are registered and published by the ISO 9362 Registration Authority in the ISO directory of BICs, and consists of eight (8) or eleven (11) contiguous characters.

C7 Country

The code is checked against the list of country names obtained from the United Nations (ISO 3166, Alpha-2 code).

C8 DescriptionPresenceRule

If Description is not present then either ISIN or at least one occurrence of OtherIdentification must be present.

C9 DescriptionUsageRule

Description must be used alone as the last resort.

C10 EventTypeRule

The use of a specific corporate action event type code is allowed only if this specific event triggers a securities movement as per the Event Interpretation Grid published by the Securities Market Practice Group (SMPG).

The corporate action event indicator code OTHR must only be used in case no other corporate action event code is appropriate.

The corporate action event indicator code CHAN must only be used in case no other corporate action event code is appropriate and only for an event which relates to a change.

The corporate action event indicator code REDM must only be used when the redemption is decided by the issuer and not by the holders.

C11 ISINGuideline

When an ISIN code exists, it is strongly recommended that the ISIN be used.

C12 ISINPresenceRule

If ISIN is not present then either Description or at least one occurrence of OtherIdentification must be present.

C13 NoAccountOwnerTransactionIdentificationRule

If no reference is available for the AccountOwnerTransactionIdentification, for example, the transaction was sent by fax, then the AccountOwnerTransactionIdentification must be NONREF.

C14 OtherIdentificationPresenceRule

If OtherIdentification is not present then either ISIN or Description must be present.

C15 PendingToFailingRule

A pending transaction (PEND) becomes a failing transaction (PENF) on the settlement date instructed in the message, during the end of day reporting.

C16 PlaceOfListingRule

If PlaceOfListing is used and an ISO 10383 MIC exists for the market to be identified, the ISO 10383 Market Identifier Code (MIC) must be used.

C17 ReportNumberRule

If Long number (Exact5NumericTest) is used, then the report must be a delta reports (UpdateType: DELT).

If the report has multiple pages, then the ReportNumber must remain the same through all the pages. It is a unique number to the report.

Two reports of the same type sent one after the other to the same receiver in relation to the same safekeeping account must have different ReportNumbers. For example, a daily report sent on day 1 would have ReportNumber 001, on day 2, 002, etc.

C18 ShortLongNumberRule

ShortNumber must contain the FIN message type number of the linked message. LongNumber must contain the XML message identifier of the linked message.

C19 StatusAndReasonRule

StatusAndReason must be present or Movement(*)/StatusAndReason must be present, but not both.

C20 SupplementaryDataRule

This component may not be used without the explicit approval of a SEG and submission to the RA of ISO 20022 compliant structure(s) to be used in the Envelope element.

C21 WithLinkageRule

If Code WITH is used, then the one or more instruction which are linked become bound and which must be executed together. Even if one single transactions/instructions/notifications can not be executed, then all the other transactions/instructions/notifications must also be kept pending. Therefore the use of code WITH must be limited to combine up to 2 or 3 transactions/instructions/notifications.

CodeName	Name	Definition
ACTV	ActiveTradingStatus	Trading in the security has commenced or security has been re-activated after a suspension in trading.
ATTI	Attachment	Combination of different security types to create a unit. Units are usually comprised of warrants and bonds or warrants and equities. Securities may be combined at the request of the security holder or based on market convention.
BRUP	Bankruptcy	Legal status of a company unable to pay creditors. Bankruptcy usually involves a formal court ruling. Securities may become valueless.
DFLT	BondDefault	Failure by the company to perform obligations defined as default events under the bond agreement and that have not been remedied.
BONU	BonusIssue	Bonus or capitalisation issue. Security holders receive additional assets free of payment from the issuer, in proportion to their holding.
EXRI	CallOnIntermediateSecurities	Call or exercise on nil paid securities or intermediate securities resulting from an intermediate securities distribution (RHDI). This code is used for the second event, when an intermediate securities' issue (rights/coupons) is composed of two events, the first event being the distribution of intermediate securities.
CAPD	CapitalDistribution	Corporate event pays shareholders an amount in cash issued from the capital account. There is no reduction to the face value of a single share (or the share has no par value). The number of circulating shares remains unchanged.
CAPG	CapitalGainsDistribution	Event is the distribution of profits resulting from the sale of securities. Shareholders of mutual funds, unit trusts, or SICAVs are recipients of capital gains distributions and are often reinvested in additional shares of the fund.
CAPI	Capitalisation	Increase of the current principal of a debt instrument without increasing the nominal value. It normally arises from the incorporation of due but unpaid interest into the principal. This is commonly done by increasing the pool factor value, for example, capitalisation, and negative amortisation.
DRCA	CashDistributionFromNonEligibleSecuritiesSales	Distribution to shareholders of cash resulting from the selling of non-eligible securities, for example, in the frame of a depositary receipt program.
DVCA	CashDividend	Distribution of cash to shareholders, in proportion to their equity holding.

CodeName	Name	Definition

COOP	CompanyOption	Company option may be granted by the company, allowing the holder to take up shares at some future date(s) at a pre arranged price in the company. A company may not grant options which enable the holder to take up unissued shares at a time which is five or more years from the date of the grant. Option holders are not members of a company. They are contingent creditors of a company and hence may, in some instances, be entitled to vote on and be bound by a scheme of arrangement between the creditors and the company. As many options have multiple exercise periods a company option will either lapse or carry on to the next expiry date.
CLSA	ClassActionProposedSettlement	Situation where interested parties seek restitution for financial loss. The security holder may be offered the opportunity to join a class action proceeding and would need to respond with an instruction.
CONS	Consent	Procedure that aims to obtain consent of holder to a proposal by the issuer or a third party without convening a meeting. For example, consent to change the terms of a bond.
CONV	Conversion	Conversion of securities (generally convertible bonds or preferred shares) into another form of securities (usually common shares) at a pre-stated price/ratio.
CREV	CreditEvent	Occurrence of credit derivative for which the issuer of one or several underlying securities is unable to fulfill its financial obligations (as defined in terms and conditions).

DETI	Detachment	Separation of components that comprise a security, for example, usually units comprised of warrants and bond or warrants and equity. Units may be broken up at the request of the security holder or based on market convention.
DSCL	Disclosure	Requirement for holders or beneficial owners to disclose their name, location and holdings of any issue to the issuer.

CodeName	Name	Definition
DVOP	DividendOption	Distribution of a dividend to shareholders with a choice of benefit to receive. Shareholders may choose to receive shares or cash. To be distinguished from DRIP as the company creates new share capital in exchange for the dividend rather than investing the dividend in the market.
DRIP	DividendReinvestment	Dividend payment where holders can keep cash or have the cash reinvested in the market by the issuer into additional shares in the issuing company. To be distinguished from DVOP as the company invests the dividend in the market rather than creating new share capital in exchange for the dividend.
DRAW	Drawing	Securities are redeemed in part before the scheduled final maturity date. It is done without any pool factor reduction. The redemption is reflected in a debit of the face amount (FAMT). Drawing is distinct from partial call since drawn bonds are chosen by lottery. Therefore, not every holder is affected in the same way.
DTCH	DutchAuction	Action by a party wishing to acquire a security. Holders of the security are invited to make an offer to sell, within a specific price range. The acquiring party will buy from the holder with lowest offer.
EXOF	Exchange	Exchange of holdings for other securities and/or cash. The exchange can be either mandatory or voluntary involving the exchange of outstanding securities for different securities and/or cash. For example "exchange offer", "capital reorganisation" or "funds separation".

Presence: [1..1]

Definition: Standard code to specify the method used to compute accruing interest of a financial instrument.

Datatype: "InterestComputationMethod2Code" on page 3257

CodeName	Name	Definition
A001	IC30360ISDAor30360AmericanBasicRule	Method whereby interest is calculated based on a 30-day month and a 360-day year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month, except for February, and provided that the interest period started on a 30th or a 31st. This means that a 31st is assumed to be a 30th if the period started on a 30th or a 31st and the 28 Feb (or 29 Feb for a leap year) is assumed to be the 28th (or 29th). This is the most commonly used 30/360 method for US straight and convertible bonds.
A002	IC30365	Method whereby interest is calculated based on a 30-day month in a way similar to the 30/360 (basic rule) and a 365-day year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month, except for February. This means that a 31st is assumed to be the 30th and the 28 Feb (or 29 Feb for a leap year) is assumed to be the 28th (or 29th).
A003	IC30Actual	Method whereby interest is calculated based on a 30-day month in a way similar to the 30/360 (basic rule) and the assumed number of days in a year in a way similar to the Actual/Actual (ICMA). Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month, except for February. This means that the 31st is assumed to be the 30th and 28 Feb (or 29 Feb for a leap year) is assumed to be the 28th (or 29th). The assumed number of days in a year is computed as the actual number of days in the coupon period multiplied by the number of interest payments in the year.
A004	Actual360	Method whereby interest is calculated based on the actual number of accrued days in the interest period and a 360-day year.

CodeName	Name	Definition
A005	Actual365Fixed	Method whereby interest is calculated based on the actual number of accrued days in the interest period and a 365-day year.
A006	ActualActualICMA	Method whereby interest is calculated based on the actual number of accrued days and the assumed number of days in a year, that is, the actual number of days in the coupon period multiplied by the number of interest payments in the year. If the coupon period is irregular (first or last coupon), it is extended or split into quasi-interest periods that have the length of a regular coupon period and the computation is operated separately on each quasi-interest period and the intermediate results are summed up.
A007	IC30E360orEuroBondBasismodel1	Method whereby interest is calculated based on a 30-day month and a 360-day year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month. This means that the 31st is assumed to be the 30th and the 28 Feb (or 29 Feb for a leap year) is assumed to be equivalent to 30 Feb. However, if the last day of the maturity coupon period is the last day of February, it will not be assumed to be the 30th. It is a variation of the 30/360 (ICMA) method commonly used for eurobonds. The usage of this variation is only relevant when the coupon periods are scheduled to end on the last day of the month.
A008	ActualActualISDA	Method whereby interest is calculated based on the actual number of accrued days of the interest period that fall (falling on a normal year, year) divided by 365, added to the actual number of days of the interest period that fall (falling on a leap year, year) divided by 366.
A009	Actual365LorActuActubasisRule	Method whereby interest is calculated based on the actual number of accrued days and a 365-day year (if the coupon payment date is NOT in a leap year) or a 366-day year (if the coupon payment date is in a leap year).
A010	ActualActualAFB	Method whereby interest is calculated based on the actual number of accrued days and a 366-day year (if 29 Feb falls in the coupon period) or a 365-day year (if 29 Feb does not fall in the coupon period). If a coupon period is longer than one year, it is split by repetitively separating full year subperiods counting backwards from the end of the coupon period (a year backwards from 28 Feb being 29 Feb, if it exists). The first of the

CodeName	Name	Definition
		subperiods starts on the start date of the accrued interest period and thus is possibly shorter than a year. Then the interest computation is operated separately on each subperiod and the intermediate results are summed up.
A011	IC30360ICMAor30360basicrule	Method whereby interest is calculated based on a 30-day month and a 360-day year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month, except for February. This means that the 31st is assumed to be the 30th and 28 Feb (or 29 Feb for a leap year) is assumed to be the 28th (or 29th). It is the most commonly used 30/360 method for non-US straight and convertible bonds issued before 1 January 1999.
A012	IC30E2360orEurobondbasismodel2	Method whereby interest is calculated based on a 30-day month and a 360-day year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month, except for the last day of February whose day of the month value shall be adapted to the value of the first day of the interest period if the latter is higher and if the period is one of a regular schedule. This means that the 31st is assumed to be the 30th and 28 Feb of a non-leap year is assumed to be equivalent to 29 Feb when the first day of the interest period is the 29th, or to 30 Feb when the first day of the interest period is the 30th or the 31st. The 29th day of February in a leap year is assumed to be equivalent to 30 Feb when the first day of the interest period is the 30th or the 31st. Similarly, if the coupon period starts on the last day of February, it is assumed to produce only one day of interest in February as if it was starting on 30 Feb when the end of the period is the 30th or the 31st, or two days of interest in February when the end of the period is the 29th, or three days of interest in February when it is 28 Feb of a non-leap year and the end of the period is before the 29th.
A013	IC30E3360orEurobondbasismodel3	Method whereby interest is calculated based on a 30-day month and a 360-day year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month. This means that the 31st is assumed to be the 30th and 28 Feb (or 29 Feb for a leap year) is assumed to be equivalent to 30 Feb. It is a variation of the 30E/360 (or Eurobond basis) method where the last day of February is always

CodeName	Name	Definition
		assumed to be the 30th, even if it is the last day of the maturity coupon period.
A014	Actual365NL	Method whereby interest is calculated based on the actual number of accrued days in the interest period, excluding any leap day from the count, and a 365-day year.
NARR	Narrative	Other method than A001-A020. See Narrative.

82.2.2.77 InterestComputationMethod2Code

Definition: Specifies the method used to compute accruing interest of a financial instrument.

Type: CodeSet

CodeName	Name	Definition
A001	IC30360ISDAor30360AmericanBasicRule	Method whereby interest is calculated based on a 30-day month and a 360-day year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month, except for February, and provided that the interest period started on a 30th or a 31st. This means that a 31st is assumed to be a 30th if the period started on a 30th or a 31st and the 28 Feb (or 29 Feb for a leap year) is assumed to be the 28th (or 29th). This is the most commonly used 30/360 method for US straight and convertible bonds.
A002	IC30365	Method whereby interest is calculated based on a 30-day month in a way similar to the 30/360 (basic rule) and a 365-day year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month, except for February. This means that a 31st is assumed to be the 30th and the 28 Feb (or 29 Feb for a leap year) is assumed to be the 28th (or 29th).
A003	IC30Actual	Method whereby interest is calculated based on a 30-day month in a way similar to the 30/360 (basic rule) and the assumed number of days in a year in a way similar to the Actual/Actual (ICMA). Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month, except for February. This means that the 31st is assumed to be the 30th and 28 Feb (or 29 Feb for a leap year) is assumed to be the 28th (or 29th). The

CodeName	Name	Definition
		assumed number of days in a year is computed as the actual number of days in the coupon period multiplied by the number of interest payments in the year.
A004	Actual360	Method whereby interest is calculated based on the actual number of accrued days in the interest period and a 360-day year.
A005	Actual365Fixed	Method whereby interest is calculated based on the actual number of accrued days in the interest period and a 365-day year.
A006	ActualActualICMA	Method whereby interest is calculated based on the actual number of accrued days and the assumed number of days in a year, that is, the actual number of days in the coupon period multiplied by the number of interest payments in the year. If the coupon period is irregular (first or last coupon), it is extended or split into quasi-interest periods that have the length of a regular coupon period and the computation is operated separately on each quasi-interest period and the intermediate results are summed up.
A007	IC30E360orEuroBondBasismodel1	Method whereby interest is calculated based on a 30-day month and a 360-day year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month. This means that the 31st is assumed to be the 30th and the 28 Feb (or 29 Feb for a leap year) is assumed to be equivalent to 30 Feb. However, if the last day of the maturity coupon period is the last day of February, it will not be assumed to be the 30th. It is a variation of the 30/360 (ICMA) method commonly used for eurobonds. The usage of this variation is only relevant when the coupon periods are scheduled to end on the last day of the month.
A008	ActualActualISDA	Method whereby interest is calculated based on the actual number of accrued days of the interest period that fall (falling on a normal year, year) divided by 365, added to the actual number of days of the interest period that fall (falling on a leap year, year) divided by 366.
A009	Actual365LorActuActubasisRule	Method whereby interest is calculated based on the actual number of accrued days and a 365-day year (if the coupon payment date is NOT in a leap year) or a 366-day year (if the coupon payment date is in a leap year).
A010	ActualActualAFB	Method whereby interest is calculated based on the actual number of accrued

CodeName	Name	Definition
		days and a 366-day year (if 29 Feb falls in the coupon period) or a 365-day year (if 29 Feb does not fall in the coupon period). If a coupon period is longer than one year, it is split by repetitively separating full year subperiods counting backwards from the end of the coupon period (a year backwards from 28 Feb being 29 Feb, if it exists). The first of the subperiods starts on the start date of the accrued interest period and thus is possibly shorter than a year. Then the interest computation is operated separately on each subperiod and the intermediate results are summed up.
A011	IC30360ICMAor30360basicrule	Method whereby interest is calculated based on a 30-day month and a 360-day year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month, except for February. This means that the 31st is assumed to be the 30th and 28 Feb (or 29 Feb for a leap year) is assumed to be the 28th (or 29th). It is the most commonly used 30/360 method for non-US straight and convertible bonds issued before 1 January 1999.
A012	IC30E2360orEurobondbasismodel2	Method whereby interest is calculated based on a 30-day month and a 360-day year. Accrued interest to a value date on the last day of a month shall be the same as to the 30th calendar day of the same month, except for the last day of February whose day of the month value shall be adapted to the value of the first day of the interest period if the latter is higher and if the period is one of a regular schedule. This means that the 31st is assumed to be the 30th and 28 Feb of a non-leap year is assumed to be equivalent to 29 Feb when the first day of the interest period is the 29th, or to 30 Feb when the first day of the interest period is the 30th or the 31st. The 29th day of February in a leap year is assumed to be equivalent to 30 Feb when the first day of the interest period is the 30th or the 31st. Similarly, if the coupon period starts on the last day of February, it is assumed to produce only one day of interest in February as if it was starting on 30 Feb when the end of the period is the 30th or the 31st, or two days of interest in February when the end of the period is the 29th, or three days of interest in February when it is 28 Feb of a non-leap year and the end of the period is before the 29th.
A013	IC30E3360orEurobondbasismodel3	Method whereby interest is calculated based on a 30-day month and a 360-day year. Accrued interest to a value date on the last day of a month shall be the

CodeName	Name	Definition
		same as to the 30th calendar day of the same month. This means that the 31st is assumed to be the 30th and 28 Feb (or 29 Feb for a leap year) is assumed to be equivalent to 30 Feb. It is a variation of the 30E/360 (or Eurobond basis) method where the last day of February is always assumed to be the 30th, even if it is the last day of the maturity coupon period.
A014	Actual365NL	Method whereby interest is calculated based on the actual number of accrued days in the interest period, excluding any leap day from the count, and a 365-day year.
